Hospital Patient Dashboard

Project Brief

Problem Statement

Patients often need to contact hospital staff to confirm appointments, check appointment details, find available services, or obtain their reports. When this information is spread across different channels, accessing it can be inconvenient for patients and creates additional administrative work for hospital staff. A secure, centralized patient dashboard can provide patients with convenient access to their appointment information, notifications, hospital services, and authorized reports after login.

Features

- View upcoming appointments and their status.
- Check appointment dates, times, doctors, and departments.
- Receive appointment confirmations, reminders, and cancellation updates.
- View recent notifications.
- Explore available hospital services.
- Access appointment history.
- Manage basic account information.
- View authorized medical reports through a secure patient account.

Privacy note: Medical reports should only be visible to the authenticated patient or an appropriately authorized representative.
